Docket No.: 12952-US-PA

AMENDMENT

Please amend the application as indicated hereafter.

In the Claims:

1. (currently amended) A pixel structure, comprising:

a scan line, disposed over a substrate;

a redundant scan line, disposed over the scan line;

a dielectric layer, disposed between the scan line and the redundant scan line,

wherein more than ~~at least~~ three first contact holes are formed in the dielectric layer,

wherein through which the scan line is electrically connected with the redundant scan line

through at least one or more first contact holes that expose a portion of the scan line;

~~a data line, disposed over the substrate;~~

an active component, disposed adjacent to ~~an intersection of the scan line and the~~
~~data line;~~ and

a pixel electrode, electrically connected to the active component, wherein the
active component is controlled by the scan line to write an image signal ~~transmitted by~~
~~the data line~~ to the pixel electrode.

2. (currently amended) The pixel structure of claim 1, further comprising:

a data line, disposed over the substrate; and

a redundant data line, disposed under the data line, wherein the dielectric layer is
disposed between the data line and the redundant data line, and the dielectric layer further
has comprises more than ~~at least~~ three second contact holes, wherein through which the

Customer No.: 31561

Docket No.: 12952-US-PA

data line is electrically connected with the redundant data line through at least one or more second contact holes that expose a portion of the redundant data line.

3. (currently amended) The pixel structure of claim 1, further comprising:

a data line, disposed over the substrate; and

a redundant data line, disposed under the data line, wherein the dielectric layer is disposed between the data line and the redundant data line, and a third contact hole having a size in a range of about 20um to about a length of the data line is formed in the dielectric layer through which the data line is electrically connected with the redundant data line.

4. (original) The pixel structure of claim 3, wherein the third contact hole comprises a rectangular hole, and a length of the rectangular hole is in a range of about 20um to about a length of the data line.

5. (original) The pixel structure of claim 3, wherein the active component comprises a thin film transistor (TFT).

6. (currently amended) A pixel structure, comprising:

a scan line, disposed over a substrate;

a redundant scan line, disposed over the scan line;

a dielectric layer, disposed between the scan line and the redundant scan line, wherein more than three a first contact holes are ~~hole having a size in a range of about 20um to about a length of the scan line~~ is formed in the dielectric layer, wherein through which the scan line is electrically connected with the redundant scan line through at least one or more first contact holes that expose a portion of the scan line;

Customer No.: 31561
Application No.: 10/709,306
Docket No.: 12952-US-PA

a data line, disposed over the substrate;

an active component, disposed adjacent to an intersection of the scan line and the data line; and

a pixel electrode, electrically connected to the active component, wherein the active component is controlled by the scan line control to write an image signal transmitted by the data line to the pixel electrode.

7. (currently amended) The pixel structure of claim 6, wherein the first contact ~~holes comprise hole-comprises~~ a rectangular ~~shape hole~~ having a length in a range of about 20um to about a length of the scan line.

8. (currently amended) The pixel structure of claim 6, further comprising:

a redundant data line, disposed under the data line, wherein the dielectric layer is disposed between the data line and the redundant data line, and at least three second contact holes are formed in the dielectric layer, wherein through which the data line is electrically connected with the redundant data line through at least one or more second contact holes that expose a portion of the redundant data line.

9. (original) The pixel structure of claim 6, further comprising:

a redundant data line, disposed under the data line, wherein the dielectric layer is disposed between the data line and the redundant data line between, and a third contact hole having a size in a range of about 20um to about a length of the data line through which the dielectric layer the data line is electrically connected with the redundant data line.

Customer No.: 31561
Application No.: 10/709,306
Docket No.: 12952-US-PA

10. (original) The pixel structure of claim 9, wherein the third contact hole comprises a rectangular hole having a length in a range of about 20um to about a length of the data line.

11. (original) The pixel structure of claim 6, wherein the active component comprises a thin film transistor (TFT).

12. (currently amended) A pixel structure, comprising:

a scan line, disposed over a substrate;

a data line, disposed over the substrate;

a redundant data line, disposed under the data line;

a dielectric layer, disposed between the data line and the redundant data line,

wherein more than ~~at least~~ three ~~first~~ contact holes are formed in the dielectric layer,

wherein through which the data line is electrically connected with the redundant data line

through at least one or more contact holes that expose a portion of the redundant data line;

an active component, disposed adjacent to an intersection of the scan line and the data line; and

a pixel electrode, electrically connected to the active component, wherein the active component is controlled by the scan line to write an image signal transmitted by the data line to the pixel electrode.

13. (original) The pixel structure of claim 12, wherein the active component comprises a thin film transistor (TFT).

14. (original) A pixel structure, comprising:

a scan line, disposed over a substrate;

Customer No.: 31561
Application No.: 10/709,306
Docket No.: 12952-US-PA

a data line, disposed over the substrate;

a redundant data line, disposed under the data line;

a dielectric layer, disposed between the data line and the redundant data line,
wherein a first contact hole having a size in a range of about 20um to about a length of
the data line is formed in the dielectric layer through which the data line is electrically
connected with the redundant data line;

an active component, disposed adjacent to an intersection of the scan line and the
data line; and

a pixel electrode, electrically connected to the active component, wherein the
active component is controlled by the scan line control to write an image signal
transmitted by the data line to the pixel electrode.

15. (original) The pixel structure of claim 14, wherein the first contact hole
comprises a rectangular hole having a length in a range of about 20um.

16. (original) The pixel structure of claim 14, wherein the active component
comprises a thin film transistor (TFT).
